

# The function of installing a rain cover on a distribution box

## Overview

By diverting water away from critical entry points, rain hoods help minimize corrosion, electrical faults, and long-term enclosure damage.

## Key Takeaways

A rain cover or hood protects your distribution box from moisture, and proper installation ensures safety and longevity of electrical components.

## Choosing the Right Rain Cover

Select a cover designed for your distribution box size and type. Options include enclosure rain hoods or drip shields, which deflect rain and prevent water from entering through doors, gaskets, or cable entry points. Materials like stainless steel or treated metals are durable and corrosion-resistant, suitable for outdoor or harsh environments.

Ensure the cover is compatible with your box's orientation and allows access for maintenance without compromising protection. Preparation  
De-energize the circuit: Turn off the breaker controlling the distribution box to prevent electrical shock. Clean the surface: Remove dirt, debris, or old sealant from the top and sides of the box to ensure proper adhesion and mounting.

Check mounting points: Identify pre-drilled holes or areas where the rain hood or drip shield will attach.

## Installation Steps

**Position the cover:** Place the rain hood or drip shield at the top of the distribution box, ensuring it extends outward to deflect water away from doors and cable entries.

**Secure the cover:** Use screws or bolts provided with the cover, fastening it to the box or wall. Ensure it is level and stable.

**Seal edges if necessary:** Apply a weatherproof sealant along the edges where the cover meets the box to prevent water ingress. **Install additional drip shields:** If your setup has side openings or cable entries, attach side shields to redirect water away from vulnerable points. **Test accessibility:** Open and close the box doors to confirm the cover does not obstruct operation or maintenance.

## Additional Tips

For boxes with active plugs or cords, consider a “while-in-use” cover or bubble-style enclosure to protect connections while in operation. Ensure the cover does not interfere with ventilation or heat dissipation of the distribution box. Regularly inspect the cover for damage, corrosion, or loose fasteners, especially after storms.

By following these steps, your distribution box will be effectively shielded from rain, reducing the risk of corrosion, electrical faults, and equipment failure while maintaining safe access for maintenance.
